BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

MAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

40482

From: Sent: To: Subject: Rao, Manjunath N.

Wednesday, April 18, 2001 3:50 PM STIC-Biotech/ChemLib

Sequence search request for 09/262,126

From: Manjunath N. Rao

Art Unit 1652, Room 10D04

Phone: 306-5681

Date: 4-18-01

Please search the following as soon as possible for application with serial number 09/262,126

SEQ ID NO:. 1 against all nucleic acid databases including issued patents database and pending application database and provide a print of all results.

SEQ ID NO: 2-4 against all protein databases including issued patents database and pending application database. and provide a print of all results.

If you have any questions please call me at the above phone number.

Thanks

Manjunath N. Rao Art Unit 1652 Room CM1, 10D04 Phone 306-5681

This search was run on the machines we identify as Compugen1, abss03, abss04, or abss05. The databases on these machines are exactly the same as those on the other machines. However, for searches run on the listed machines, two sets of results are now generated when the Pending Nucleic Acid and/or Pending Amino Acid databases are searched. The Pending databases have been split into two parts to reduce the amount of time

Searches run against the Nucleic Acid Pending database will produce two sets of results, with the extensions .rnpm

Searches run against the Amino Acid Pending database will produce two sets of results, with the extensions .rapm and .rapn

Because they contain data that is confidential, the results of Pending database searches should not be left in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents Bacillus deramificans strain CC T89 117D DNA coding for mature pullulanase (EC-3.2.1.41). This CC enzyme has a pl of 4.1-4.5, has a half-life of about 55 hr at 60 CC deg C and 1s capable of catalysing the hydrolysis of CC deg C and 1s capable of catalysing the hydrolysis of CC invention relates to the discovery that B. deramificans pullulanase recombinantly produced in a Bacillus host is modified yet retains CC the ability to catalyse the hydrolysis of an alpha-1,6-glucosidic bond. The modification of the recombinant pullulanase appears to be a result of misprocessing of the signal sequence by a signal cC peptidase as well as susceptibility to extracellular proteclytic CC processing. The invention provides modified pullulanases, nucleic acids encoding them, vectors, host cells and methods for CC the starch industry for the saccharification of aqueous liquefied starch, forming syrups of high glucose and maltose content. Other uses (not claimed) are: as anti-staling additives in bread; in the preparation of oligosaccharides from amylopectin or of the proparation of oligosaccharides from amylopectin or of tertaholosides from maltose; to condense mono or oligosaccharides, cor in the pharmaceutical industry (no details). When used for custoris as short reaction times, without losses associated with corrects on reaction products, especially they provide higher glucose contents of by-products, especially they provide higher glucose contents of the pharmaceutical industry (no details). When used for exercision reaction products, without losses associated with the pharmaceutical industry (no details) in the material contents of dissolved solids in the material contents of signal products of dissolved solids in the material contents of contents of the process.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

The pullulanse hydrolyses the alpha-1,6-glycosidic bonds of amylopectin and of pullulan. The enzyme can be used (with glucoamylase) for saccharification of starch. Typical applications include use as anti-staling additives in bread making and brewing, in preparation of low calorie foods and to clarify fruit juices.
                                                                                                                                                                                                                                                                                                                                                                                 1310

                                                                                                                                             This sequence codes for the mature pullulanase enzyme isolated from Bacillus deramificans 7 89.117D. The pullulanase hydrolyses the alpha-1,6-glycosidic bonds of amylopectin and of pullulan. The enzyme can be used (with glucoamylase) for saccharification of starch. Typical applications include use as anti-staling additives in bread making and brewing, in preparation of low calorie foods and to clarify fruit juices.
                                                                                                                                                                                                                              New pullulanase from Bacillus deramificans - 1 saccharification etc., with good stability over ranges, also related DNA vectors, transformed

                              The present sequence encodes a trimmed enzyme isolated from Bacillus sp. APC-9603. The present specification also describes: (1) a vector containing the DNA encoding a trimmed enzyme; (2) a recombinant microbe transformed by the DNA; and (3) preparation of a trimmed enzyme in which the microbe of (2) is cultured and the trimmed enzyme is collected from the culture. The method can prepare a trimmed enzyme of wide substrate specificity having heat resistance and being active in acid region efficiently.

Pullulanases CC are debranching enzymes which can attack amylopectin. This sequence CC represents a parent enzyme from which genetically engineered variant CC debranching enzymes can be created. The genetically engineered to the CC an improved thermostability at a pH in the range of 4-6 compared to the CC parent enzyme. The modified enzyme may alternatively or also have an CC increased activity towards amylopectin and or glycogen compared to the CC parent enzyme. The enzyme variants are useful for converting starch to one CC or more sugars. This is useful when starches such as corn, potato, wheat, CC manioc and rice starch are used as starting materials in commercial CC large scale production of sugars, such as high fructose syrup, high CC maltose syrup, maltodextrins, amylose, G4-G6 oligosaccharides and other CC carbohydrates such as fat replacers. The thermostable debranching enzymes CC of the invention make it possible to perform liquefaction and debranching cCC simultaneously before the saccharification step. By debranching using the thermostable debranching enzyme variants during liquefaction together collisted to the action of an alpha-amylase, the formation of panose precursors of the threby reducing the panose content in the final reducing and collisted to the product and collisted the collisted that the collisted the collisted the collisted that the colli

No. 174037/88) was cleaved by various restriction enzymes and inserted into plasmid pvil8/119. Single-stranded DNA was prepd. using helper phage M13K07 and the base sequence determined by the dideoxy method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence may be contained in a recombinant plasmid. The heat-resistant pullanase can be produced in large amts. using a suitable

The invention provides 18 polynucleotides (see V36907-24) coding for thermostable glycosidases (see W49858-75) having glucosidase, alpha-galactosidase, beta-mannosidase, beta-mannase, endoglucanase or pullulanase activity. Vectors and host cells are also claimed. A method is provided for producing the enzymes by recombinant techniques. A claimed method for generating glucose from soluble cell oligosaccharides comprises contacting a sample (selected from dairy products, fruit juice, detergent, textile, guar gum, animal food products, fruit juice, detergent, textile, guar gum, animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Glycosidase enzymes from organisms of the genera Staphlothermus, Pyrococcus and Thermococcus - for deriving sugar from oligosaccharides, useful in the e.g. food processing, textile or

The enzyme or its encoding nucleic acid sequence is used for generating glucose from soluble oligosaccharides. The enzyme can be used in the food processing, pharmaceutical, textile, detergent and baking industries. The enzyme is also used to treat lactose intolerance, as a diagnostic reporter molecule, in corn wet milling or in the fruit juice industry. The enzymes can be used to hydrolyse guar gum to remove enzyme may be used to generate probes to identify similar sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim

composition in the present invention also describes an isolated nucleic acid conclude encoding a homologue of any of the fragments of the S.pneumoniae genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced by a process comprising: (a) screening a genomic DNA library using as a comprise a target sequence defined by any of the sequences in SEQ ID NO:1 to 391, identifying members of the library which contain sequences at that hybridise to the target sequence and isolating the nucleic acid concludes from the members; or (b) isolating mRNA, DNA or cDNA produced from an organism, amplifying nucleic acid molecules whose nucleotide sequence is homologous to amplification primers derived from the concent of the S. pneumoniae genome to prime the amplification and isolating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying fragments of the S. pneumoniae genome. Products from the present compositions and vaccines for S. pneumoniae, and pharmaceutical compositions and vaccines for S. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (V52134 to V55524) recorded on it, or a representative fragment or a sequence at least 95% identical to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO: 1 to 391 (V52134 to V52524) are genomic fragments from Streptococcus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence encodes a novel debranching enzyme isolated from 2em mays (maize). This enzyme has been used in the production of transgenic plants in which the nucleic acid is stably integrated into the host cell's genome and expressed. Such an enzyme can be used in the production of starch which is useful in the food industry or in the production of industrial products e.g. paper, adhesives, textiles, textile care products, building materials, soil stabilisers, agrochemicals, pharmaceutical products, cosmetics, coal briquettes, flocculants for parameteristics and coal surries, foundry sand binders, rubber goods, leather
                                                                                                                                                                                                                                                                                                                                                                                                                   1851

They may also be used to isolate cDNAs and genes encoding homologous pullulanase from the same or other plant species, to amplify those genes and to produce antibodies for screening of cDNA expression
